ECG anomaly detection — example beats

Model: mitbih_autoencoder_best.pt
Threshold (F1-optimal, real-time preprocessing): 0.0434
Records used: 100,101,102,103,104,105,106,107
Total beats inspected: 17355 Anomalies in set: 6890

Confusion matrix on these beats:

True positives	: 6605	(correctly caught)
False negatives	: 285	(missed by the model)
False positives	: 250	(false alarms)
True negatives	: 10215	(correctly cleared)

Sensitivity = 0.959

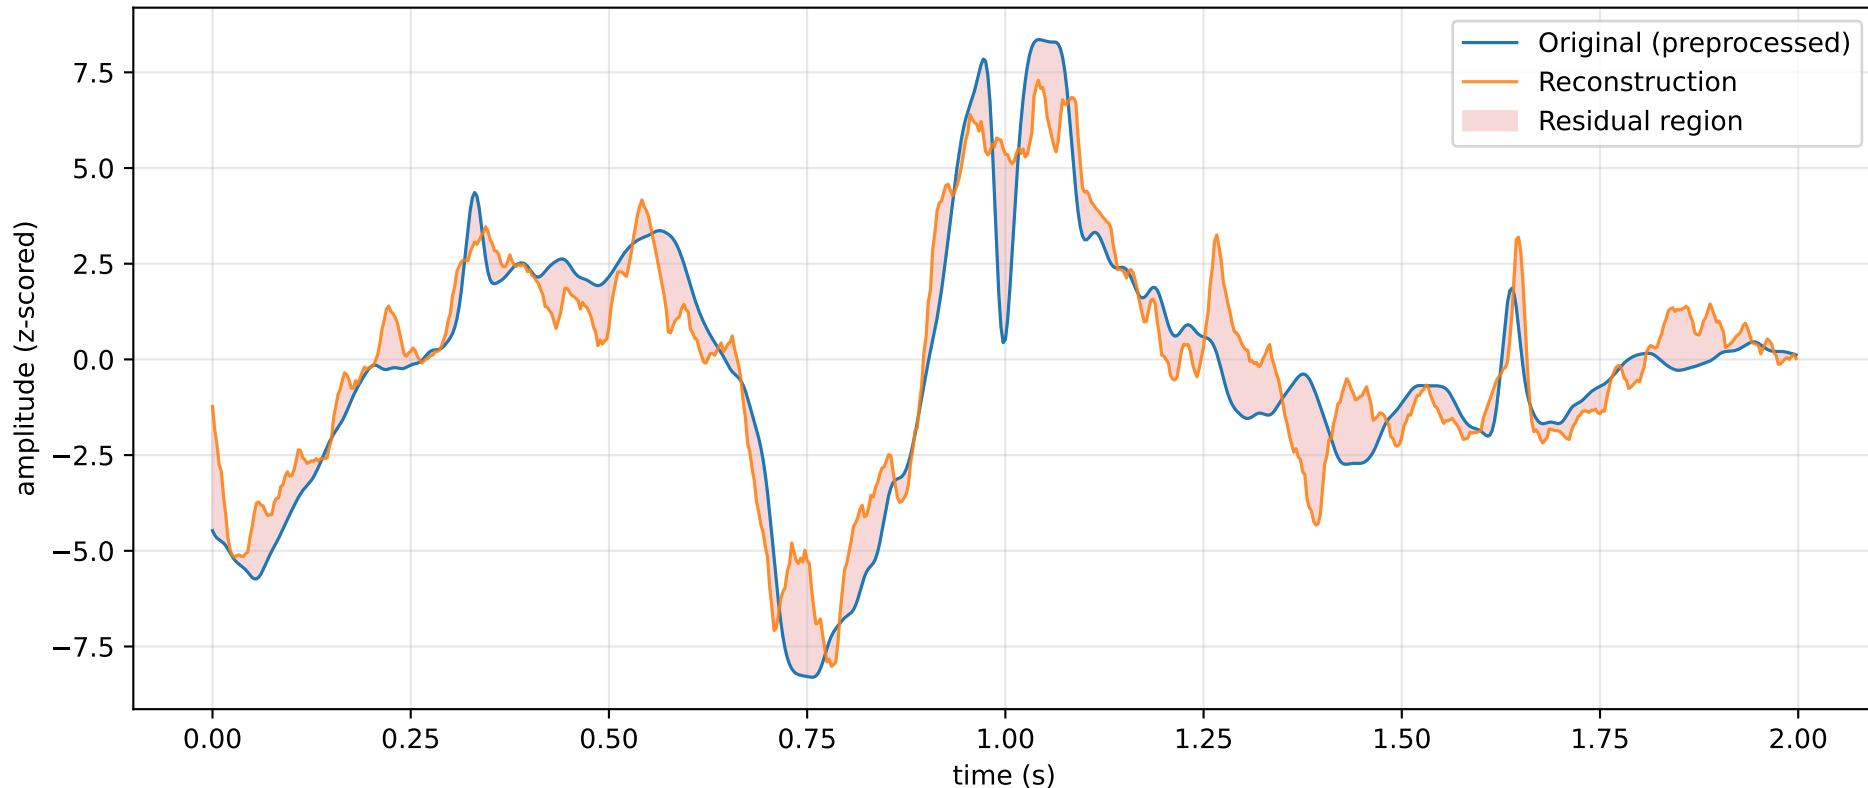

Specificity = 0.976

How to read the next pages: each page shows one 2-second window with the original ECG (blue) and the model's reconstruction (orange). The shaded red area between them is the reconstruction error. A beat is flagged when that error exceeds the threshold above.

TRUE POSITIVE — model correctly flagged abnormal

(4 example(s) follow)

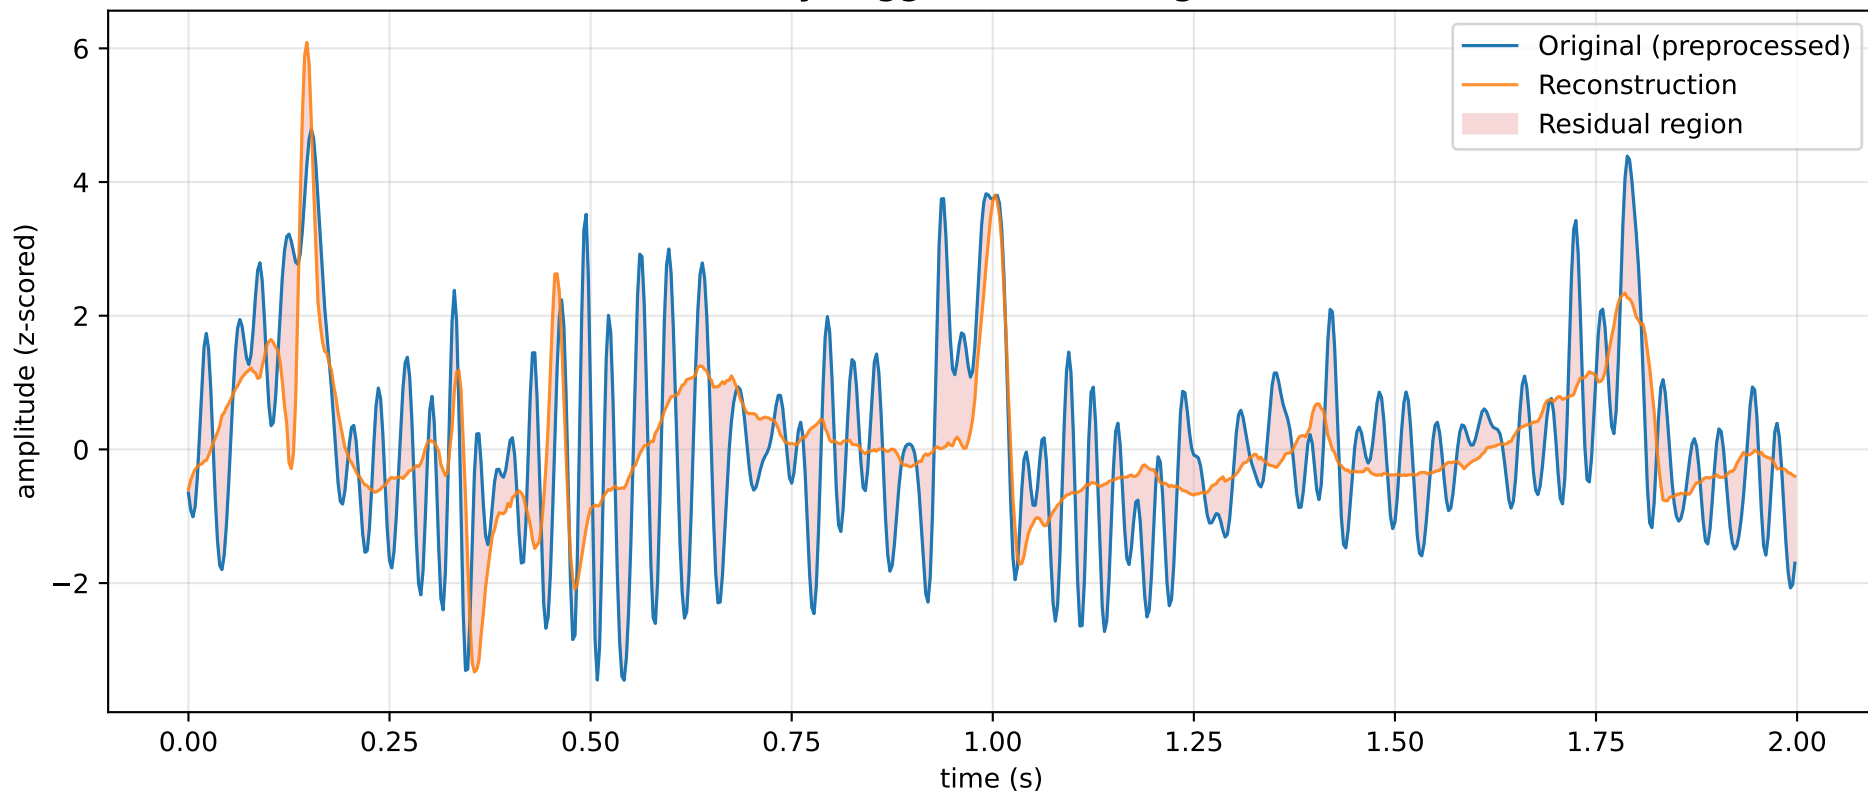

TRUE POSITIVE — model correctly flagged abnormal: ground truth = Unclassifiable (Q)

Source : rec 105, sample 444182
Beat symbol : Q (Unclassifiable)
Ground truth : ANOMALY
Residual : 1.6444
Threshold : 0.0434
Model says : ANOMALY

ANOMALY

FALSE NEGATIVE — model MISSED an abnormal beat

(4 example(s) follow)

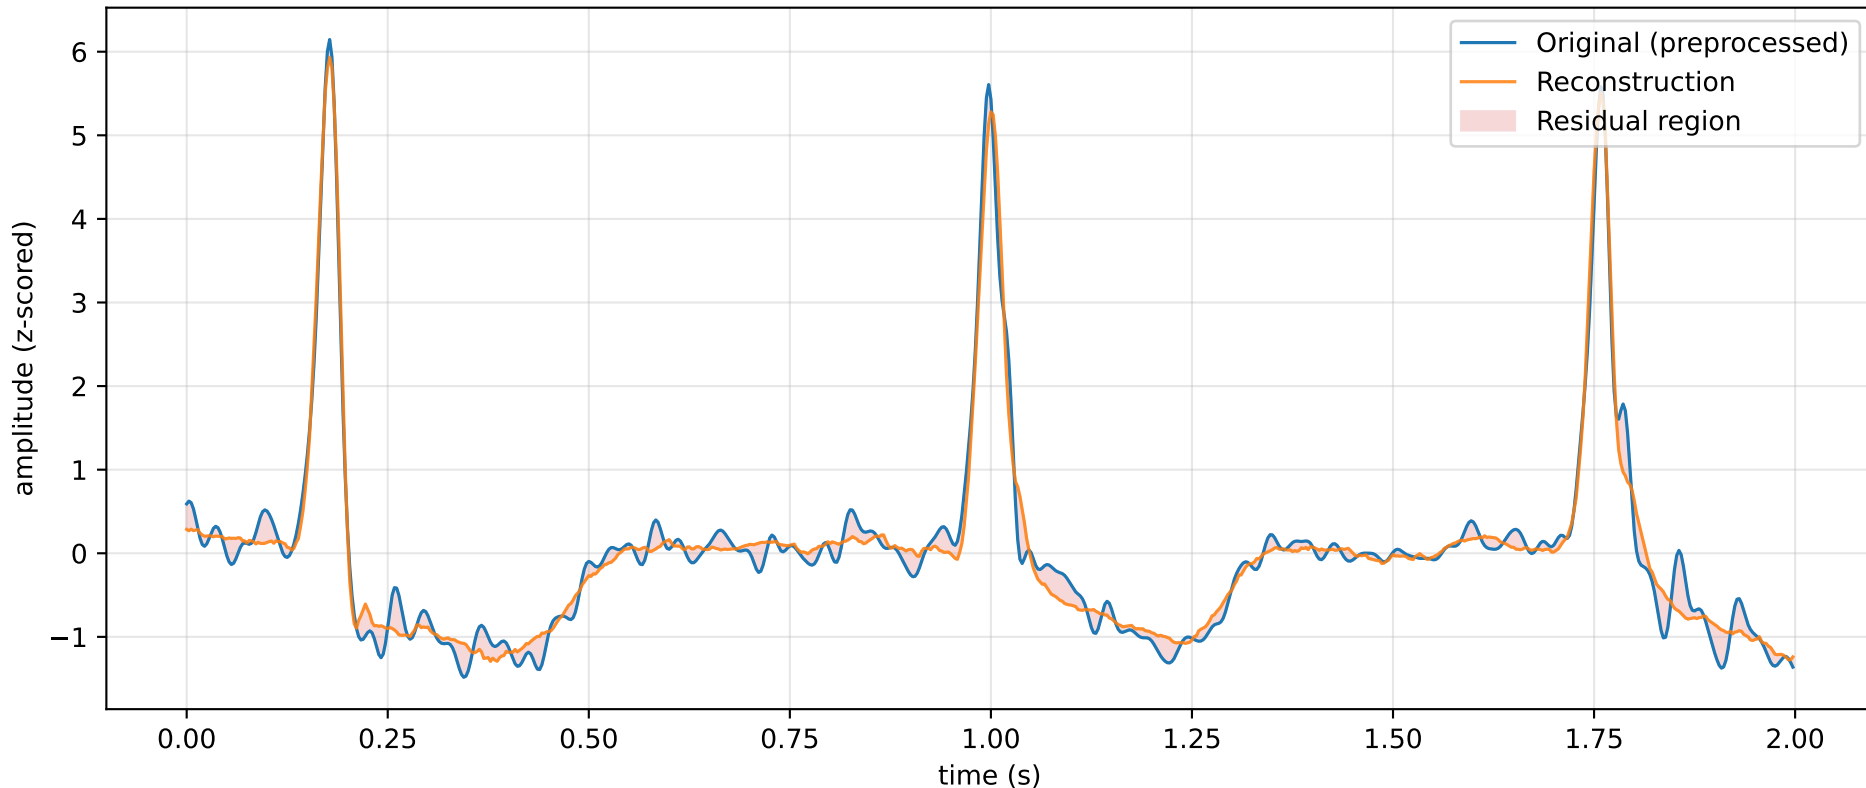

FALSE NEGATIVE — model MISSED an abnormal beat: ground truth = Fusion of paced and normal (f)

Source : rec 104, sample 284556
Beat symbol : f (Fusion of paced and normal)
Ground truth : ANOMALY
Residual : 0.0433
Threshold : 0.0434
Model says : NORMAL
